Addition polymers: from monomer to repeat unit

Teacher / technician

YEAR 11 / LESSON 105 / CHEMISTRY + SCIENCE (DOUBLE AWARD)

Staff preparation and answer guidance. Keep separate from student sheets. Written and model-based lesson; no laboratory procedure is implied.

Coverage and delivery

Shared core: 4.44–4.46. Poly(ethene), poly(propene), poly(chloroethene) and poly(tetrafluoroethene).

Allow about 60 minutes. Follow the student sequence and use the answers to check reasoning.

Requisition • class of 30, working in 15 pairs

Item	Per pair / setup	Class total
Booklet / writing tools	1 per learner	30 sets
Model kit / periodic table	1 set per pair	15 sets

Immediate safety

Desk activity only; keep small model pieces away from mouths.

Preparation and delivery

Read alongside the student method

YEAR 11 / LESSON 105 / CHEMISTRY + SCIENCE (DOUBLE AWARD)

1. Provide 30 booklets and 15 model kits or reusable atom counters; no chemicals are needed.

2. Use 10 minutes retrieval, 25 independent/pair tasks, 15 explanation and 10 corrections. Keep first attempts visible.

3. Use paper/models only; no monomer or polymerisation reagents are issued.

4. Check continuation bonds and avoid leaving C=C in the saturated addition-polymer backbone.

5. Check all carbon valencies, formula subscripts and equation coefficients. Label any supplied numbers as practice data, not class observations.

Close of lesson

- Return shared equipment and retain corrected reasoning.

Check before teaching

Check the cards, reference data and quantities against this requisition. Keep the staff answer guide separate until the checking stage. Supplied numerical practice datasets are labelled examples; they are not class measurements.

Answers and teaching notes

Expected explanations • do not give as experimental observations

YEAR 11 / LESSON 105 / CHEMISTRY + SCIENCE (DOUBLE AWARD)

- A small molecule that can join with many others to make a polymer.
- Two backbone carbons, each with two H, single bonds and continuation bonds through brackets with n.
- CH_3 side group; it does not enter the two-carbon repeating backbone.
- CH_2=CHCl, chloroethene.
- $[–CF_2–CF_2–]_n$ with all four F bonds and continuation bonds shown.
- No small molecule is lost; the monomer atoms are retained in the polymer.
