Electrolysis: mobile charge carriers

Teacher / technician

YEAR 11 / LESSON 109 / CHEMISTRY ONLY

Staff preparation and answer guidance. Keep separate from student sheets. Written and model-based lesson; no laboratory procedure is implied.

Coverage and delivery

Chemistry only: 1.55C–1.57C. Particle modelling; no molten material or live circuit.

Allow about 60 minutes. Follow the student sequence and use the answers to check reasoning.

Requisition • class of 30, working in 15 pairs

Item	Per pair / setup	Class total
Booklet / writing tools	1 per learner	30 sets
Model kit / periodic table	1 set per pair	15 sets

Immediate safety

Desk activity only; keep small model pieces away from mouths.

Preparation and delivery

Read alongside the student method

YEAR 11 / LESSON 109 / CHEMISTRY ONLY

1. Provide 30 booklets and 15 model kits or reusable atom counters; no chemicals are needed.

2. Use 10 minutes retrieval, 25 independent/pair tasks, 15 explanation and 10 corrections. Keep first attempts visible.

3. Avoid the blanket claim that every covalent substance/solution is an insulator.

4. Use diagrams only; do not heat salts or connect mains electricity.

5. Check all carbon valencies, formula subscripts and equation coefficients. Label any supplied numbers as practice data, not class observations.

Close of lesson

- Return shared equipment and retain corrected reasoning.

Check before teaching

Check the cards, reference data and quantities against this requisition. Keep the staff answer guide separate until the checking stage. Supplied numerical practice datasets are labelled examples; they are not class measurements.

Answers and teaching notes

Expected explanations • do not give as experimental observations

YEAR 11 / LESSON 109 / CHEMISTRY ONLY

- Its ions are fixed in lattice positions and cannot carry charge through the solid.
- Existing ions become mobile.
- Cation: positively charged ion; anion: negatively charged ion.
- Mobile electrons.
- Dissolving HCl produces mobile ions in water.
- Sugar remains molecular in solution, so it does not supply the mobile ions needed for substantial conduction.
